information & let us help you.

Clinical Protocol

- A** Perio probing indicates deep pockets.
- B** Laser radiation vaporizes bacteria and diseased tissue and allows for detection of tartar.
- C** Ultrasonic scaler and special hand instruments are used to remove buildup under the gum tissue.
- D** Bone is modified.
- E** Laser is used to form a gel-clot containing stem cells to promote regeneration.
- F** Reattachment of gum tissue to a clean root surface.
- G** Bite adjustment to eliminate occlusal trauma.
- H** New attachment is regenerated.

The LANAP protocol is a comprehensive, regenerative approach designed to treat moderate to severe gum disease and “hopeless” teeth using the PerioLase® MVP-7™. The LANAP protocol with FDA clearance for True Regeneration™ is also known as Laser Assisted Regeneration™ (LAR™).

Therapeutic Benefits

- Less pain, less bleeding, less swelling
- Minimal tissue loss & less sensitivity
- Faster recovery
- Modern treatment approaches for teeth & implants
